**Model Performance Testing:**

Project team shall fill the following information in model performance testing template.

| S.No. | Parameter | Screenshot / Values |
|---|---|---|
| 1. | Data Rendered | Booking data from the ServiceNow table Metro Ticket Booking (u_metro_ticket_booking): stations, journey type, passengers, amount, payment mode and status for every MTB record. |
| 2. | Data Preprocessing | Data is validated when it is entered: mandatory fields, read-only fare fields and fixed choice values (journey 1/2; payment upi/card/others). Flow Designer maps each catalog variable to the matching table field. |
| 3. | Utilization of Data Filters | ServiceNow list filters / condition builder, e.g. Mode of Payment = UPI, Starting From = Ameerpet, Created = Today. |
| 4. | DAX Queries Used | Not applicable – Power BI is not used. ServiceNow list filters use encoded queries (e.g. u_mode_of_payment=upi) instead of DAX. |
| 5. | Dashboard design | No of Visualizations / Graphs - 0 (no dashboard built in Phase 1). Planned: bookings per route, payment-mode share, bookings by hour. |
| 6 | Report Design | No of Visualizations / Graphs - 0. Planned report: daily booking list with total fare collected per route. |
