Project Design Phase
Proposed Solution Template

Date	14 October 2026
Team ID	
Project Name	Metro Ticket Generating System
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Metro passengers waste time in long queues to buy paper tickets, must carry cash and do not know the fare in advance. Station staff have no single digital record of bookings to verify tickets or analyse travel.
2.	Idea / Solution description	A ServiceNow-based Metro Ticket Generating System. Passengers open the Service Portal, fill the 'Book A Metro Ticket' form (source, destination, journey type, passengers, payment mode). A client script calculates the fare instantly, a QR ticket is shown in a portal widget, and on confirmation a request (REQ/RITM) is created. Flow Designer stores the booking in the Metro Ticket Booking table and creates a verification task for Station Managers.
3.	Novelty / Uniqueness	Built fully on a low-code enterprise platform – no separate servers or databases. Combines booking, fare logic, QR ticket, data storage, task routing and security (ACLs) in one place. New stations and routes are added as data, without changing code.
4.	Social Impact / Customer Satisfaction	Shorter queues and faster entry for commuters; cashless choice (UPI, card, others); paperless tickets support environmental goals; station staff get a clear, traceable record of each booking, improving trust and service quality.
5.	Business Model (Revenue Model)	Metro operator saves on printing paper tokens and staffing counters. Future revenue options: convenience fee per online booking, partner payment gateways, advertising on the portal, and monthly passes.
6.	Scalability of the Solution	New stations, lines and fare bands can be added as table records; the same platform can add payment gateway integration, SMS/email tickets, Automated Fare Collection gates and analytics dashboards; ServiceNow cloud scales to many users.
